3Z9 bevelled glass extractor

Why do I need an extractor?

An extractor (sometimes called a cooker hood) is a must for any kitchen. As well as removing steam, smoke and airborne grease (that will otherwise leave a nasty, sticky film on surfaces), a good extractor will get rid of lingering aromas – however strong. That curry you cooked yesterday may well have been delicious – but do you really want to be reminded of it a day later ?

CDA offers extractors at all price and performance levels. Level 1 products are functional and efficient; level 2 products have added features such as a higher extraction rate and designer styling while level 3 models such as the 3Z9 offer the ultimate in performance, style and functions.

When you are shopping for an extractor you'll see the extraction rate mentioned, usually followed by figures like 750m³/hr. What does it mean – and how do you choose the right extractor to suit the size of your kitchen

To keep the kitchen clean and fresh when food is being cooked the air must be changed ten times an hour. To find the size of extractor you will need, first work out the volume of the room in cubic metres then multiply the result by ten.

To work out the volume of the room multiply height, by length by width (in metres). The end result will be the volume of the room in cubic metres – so if the room measures 40 cubic metres you will need an extractor rated at 400m³/h or above – simple ! The 3Z9 from CDA operates at 750m³/hr.

Quiet please!

Quiet operation is a must especially in a kitchen diner or kitchen living room. Operating noise is expressed in dBA – here's a quick guide to help you.

Table showing sound levels (bdSPL)

Pistol being shot	140
Threshold of pain	130
	120
Underground train	110
	100
Home Hi-Fi level	90
Average factory	80
	70
Average conversation	60
Average office	50
Ambient noise	40
Quiet whisper	30
	20
	10
Threshold of hearing	0

3Z9 extractor operates at 53bdA

Ducted or re-circulating

Extractors can be installed with ducting that vents the old air out to a grille on the outside wall. Recirculating extractors pass the air through filters to clean it then blow it back into the room. If you choose a ducted model, there will be extra costs for the ducting itself and installation – but the outlay is well worthwhile as performance and air cleaning are both more effective than in recirculating models.
